Flatliner

Flatliner - the complete system for repairing body panels.

Allows you to work from the outside without removing internal parts. This significantly speeds up work times and enables you to repair the original body panel without having to replace any parts damaged during the stripping process. The Flatliner system can be used for all types of damage to body panels. Please note: Flatliner is designed for use with body panels only, and should not be used to repair structural or chassis damage to the vehicle.

Benefits of the system:

- Flatliner enables you to complete more repairs - effectively and quickly.
- Faster repairs allow you to increase throughput and to satisfy your customers with a faster turnaround.
- Reduced expenditure on parts and panels - therefore improving cash-flow.
- The cost of parts is greatly reduced and chargeable hours are increased - repair not replace!
- Flatliner easily repairs new generation HSS steels without compromising the integrity of the panel by excessive heating.
- Flatliner has an international patent.
- Approved by many car manufacturers.

Flatliner has been tested and approved by the following manufacturers:
